deBridge

deBridge **is a cross-chain interoperability and liquidity transfer protocol** that allows decentralized transfer of data and assets between various blockchains. The deBridge protocol is an infrastructure platform and hooking service for:

Arbitrum | Avalanche | BSC | ETH | Fantom | Heco | Polygon | Defi | Infrastructure | Bridge | Crosschain Liquidity | DEX | Solidity

Maximum Bounty
$200,000

Out of scope

Program's Out of Scope information

- Best practice critiques
- Centralization risks
- Gas optimizations

Default Out of Scope and rules

Smart Contract specific

- Incorrect data supplied by third party oracles
  - Not to exclude oracle manipulation/flash loan attacks
- Impacts requiring basic economic and governance attacks (e.g. 51% attack)
- Lack of liquidity impacts
- Impacts from Sybil attacks

- Impacts involving centralization risks

All categories

- Impacts requiring attacks that the reporter has already exploited themselves, leading to damage
- Impacts caused by attacks requiring access to leaked keys/credentials
- Impacts caused by attacks requiring access to privileged addresses (including, but not limited to: governance and strategist contracts) without additional modifications to the privileges attributed
- Impacts relying on attacks involving the depegging of an external stablecoin where the attacker does not directly cause the depegging due to a bug in code
- Mentions of secrets, access tokens, API keys, private keys, etc. in Github will be considered out of scope without proof that they are in-use in production
- Best practice recommendations
- Feature requests
- Impacts on test files and configuration files unless stated otherwise in the bug bounty program
- Impacts requiring phishing or other social engineering attacks against project's employees and/or customers
